Advantages of Steel

Steel is tough and more durable and lasts longer than most materials used in manufacturing. This negates the need to replace products in a few years as they will not be tired and worn. With steel we can create strong durable bonds that do not fail or become loose over time.

For security purposes a steel unit is stronger and more robust to resist (an) impact or a break in. If tampered with, you will see the damage that has been sustained.

In addition, steel is 100% recyclable, and can be reused over and over without any quality loss. It is also the most recycled material, per ton, in the world.

Our Commitment

We are committed to support a 10-year warranty and continuity of supply. Whether you require a few more matching units for your office or wish to replace a damaged part, Maine can supply the replacement parts and have the unit back to its original state of operation without the expense of replacing the complete unit.

Our units are generally finished with a hard-wearing powder coat with 1000 hrs salt spray resistance. This finish renders the product aesthetically pleasing as well as being tough, durable, and long lasting which reduces its environmental impact. All products are free from CFCs, VOCs & HCFs.

Units can be finished in a range of standard colours or if required we can match exactly to the colour and texture finish you require.

The well-engineered, projection welded frame of Maine units enables the storage to be repositioned even when fully loaded.

Our Enviromental Commitment

At present, 98% of our products are fully recyclable and 40% have already been recycled. In fact, steel can be endlessly recycled with no degradation of the product.

As a UK manufacturer, we are conscious and aware of our environmental impact and are committed to consider the following issues.

Energy Use: Operational Energy Issues

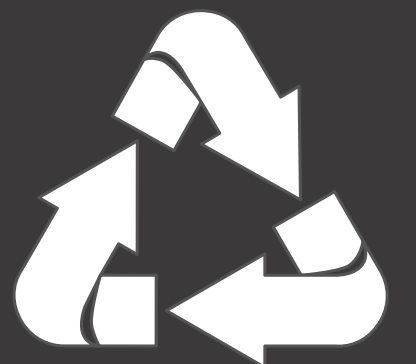

Health and Safety: Internal and External Issues affecting health and safety

Pollution: Air and water pollution issues

Packaging: Sourcing and using packaging solutions that have minimal environmental impact and footprint.

Transport: Transport related emissions including logistical planning to reduce impact and increase efficiency.

Water: Consumption and water efficiency
